

My website will have a structure and tags. I will apply what I've learned in HTML about syntax of heading, paragraph, anchor tags and link tags. I will add information to the tags to give them more control over function and appearance. My website will have a responsive navigation bar and I will add four menus: the Home, About, Services and Contact.

I will apply what I've learned in CSS about different text stylings, how to change colors, size, style, font, containers, and how to use them. I will add identifiers for HTML elements to help me operate the elements. My learnings on how the box model and positionings make the HTML elements be organized will help my website to be neat and tidy.
